Limitless - Looking Beyond RICE and MEAT

We believe that human potential is limitless. As specialists in the functioning of the human body, we have a reputation as 'recovery specialists' since we help heal bones, muscles, and joints.

Regarding what we can do for you, injury recovery is just the tip of the iceberg. Physical therapists can help athletes achieve peak performance, can help seniors live a healthy lifestyle and can help every single person live life with energy and vitality.

So how can we help you? The answer may surprise you. Perhaps we can help you relieve aches and pains. Perhaps we can help you become stronger and more flexible. Remember - injury or not, we are always here to help you. It's what we love doing, and we have dedicated our lives to improving the health of our patients and our community. So schedule an appointment today, and let's meet (no pun intended) to see what we can do for you.

MEAT is Good for the Body

M for Movement

Maintaining range of motion in the injured joint is an important aspect of recovery. Your physical therapist will guide you regarding specific do's and don'ts with exercise. As a general rule, the more you move, the quicker you will heal. Listen to your body, since pain is an indication that something isn't right. Your therapist will help you maintain mobility in the joints surrounding the injury. This will reduce the formation of scar tissue and decrease recovery time.

E for Exercise

As the pain reduces, you will be encouraged to increase the duration and intensity of exercise under the watchful eyes of the physical therapist. A progressive routine of exercises will increase strength, improve balance and facilitate recovery. The primary objective during this stage is to promote healing while avoiding re-injury.

A for Analgesics

'Analgesic' is a medical term for pain relieving medication. It is best to consult with your physician to determine the most appropriate medications. Your doctor may recommend that you start with over-the-counter medication. If it is not effective, your doctor may prescribe prescription medications including steroids.

T for Treatment

A physical therapist plays an important part in long-term recovery following any injury. Physical therapy treatment includes a variety of procedures and modalities, including therapeutic exercise, ultrasound, manual therapy and neuromuscular re-education using advanced techniques. A physical therapist can restore, retrain and improve the joints and muscles in the human body.

What does RICE and MEAT have to do with Physical Therapy?

Patient Testimonial

Second time using your practice. I know you will get to the root of my problem and send me away without pain. Karen J.

Do you need physical therapy?

If you have any of the following conditions we can help!

Tendonitis/ Bursitis
Sprain/ Strain
Jaw, Neck, or Back Pain
Tension Headache
Pelvic Pain/ Incontinence
Lymphedema
Trigger Points

Pre/ Post Surgical Protocols

Most Insurances Accepted!

We hope everyone enjoyed the snow. Hopefully no injuries from the snow, but if so we can help! Please do not hesitate to call us if you have a pain that is bothering you!

When you hear the words rice and meat, we won't blame you for thinking about food!

In the physical therapy world, the RICE method (rest, ice, compression, and elevation) has long been the recommended treatment for sports injuries. It is a recognized way to handle injuries, but recent reports suggest that ice and complete rest might delay recovery. Complete rest causes the muscles surrounding the injury to tighten, causing

the potential for further injury once the activity is resumed. Though ice is useful in the short window immediately after the injury, it can impede the healing process over time.

If RICE is out, what method should you use instead? It's called MEAT.

MEAT stands for "movement, exercise, analgesics, and treatment".

The theory is simple. To recover as quickly as possible from an injury, continue to move the affected joint as much as possible throughout the recovery period. Use common sense and remain within the limits of pain. Your body will tell you what it can, and cannot handle. The inflammation following an injury is part of the body's natural healing process. Increased blood flow to the area that helps repair the damaged tissue. The continued application of ice to an injury after the first few hours could in fact, a hindrance to this natural healing process.

We see WALK-INS so don't wait for a Physical Therapy appointment, when we can see you immediately.

Please call us if you are interested in *pre/post natal* classes.
